

Head Shape

We started by drawing a rectangle and marking out the eyes, nose, and mouth. We learned that the width of the eye fits between the eyes and on many faces, the width of the eye is also the width from the outside corner of the eye to the outside of the face on some people. Generally, on an oval head, the head is slightly narrower than the full eye width.

The chin is roughly as wide as the mouth.

You can use the outside of the box to help you see the head shape better. Draw this head shape on your grid. You should now have eyes, eyebrows, nose, lips, and head shape on your composite face.
